Lesson starter

Trigonometric Differentiation

Advanced Trig Compositions

Name _____

S1

Differentiate with respect to x.

$y = (\cos(-3x^2 - 8x - 4))^3$

S2

Differentiate with respect to x.

$y = (\sec(3x + 8))^2 \sin(-9x - 7)$

S3

Differentiate with respect to x.

$y = (\cot(-3x^2 + 8x - 7))^4$

S4

Differentiate with respect to x.

$y = (\tan(-4x + 3))^3 \sec(-5x + 8)$

S1

Differentiate with respect to x.

$y = (\cos(-3x^2 - 8x - 4))^3$

Answer:

$\frac{dy}{dx} = -3\,(\cos(-3x^2 - 8x - 4))^2\,\sin(-3x^2 - 8x - 4)\,(-6x - 8)$

Working:

Work from the outside in: power, then trig function, then polynomial inner function.

Outer power derivative gives $3(\cos(-3x^2 - 8x - 4))^2$.

Trig derivative gives $-\sin(-3x^2 - 8x - 4)$.

Inner derivative gives $-6x - 8$.

Multiply the three derivative parts together.

$\frac{dy}{dx} = -3\,(\cos(-3x^2 - 8x - 4))^2\,\sin(-3x^2 - 8x - 4)\,(-6x - 8)$

S2

Differentiate with respect to x.

$y = (\sec(3x + 8))^2\,\sin(-9x - 7)$

Answer:

$\frac{dy}{dx} = 6\,(\sec(3x + 8))^1\,\sec(3x + 8)\tan(3x + 8)\,\sin(-9x - 7) + (\sec(3x + 8))^2\,-9\,\cos(-9x - 7)$

Working:

This is a product, and the first factor also needs the chain rule.

Let $f = (\sec(3x + 8))^2$ and $g = \sin(-9x - 7)$.

$f' = 2(\sec(3x + 8))^{2-1}(\sec(3x + 8)\tan(3x + 8))(3)$

$f' = 6\,(\sec(3x + 8))^1\,\sec(3x + 8)\tan(3x + 8)$

$g' = (\cos(-9x - 7))(-9)$

$g' = -9\,\cos(-9x - 7)$

Apply product rule: $y' = f'g + fg'$.

$y' = (6\,(\sec(3x + 8))^1\,\sec(3x + 8)\tan(3x + 8))(\sin(-9x - 7)) + ((\sec(3x + 8))^2)(-9\,\cos(-9x - 7))$

$\frac{dy}{dx} = 6\,(\sec(3x + 8))^1\,\sec(3x + 8)\tan(3x + 8)\,\sin(-9x - 7) + (\sec(3x + 8))^2\,-9\,\cos(-9x - 7)$

S3

Differentiate with respect to x.

$y = (\cot(-3x^2 + 8x - 7))^4$

Answer:

$\frac{dy}{dx} = -4\,(\cot(-3x^2 + 8x - 7))^3\ \csc^2(-3x^2 + 8x - 7)\,(-6x + 8)$

Working:

Work from the outside in: power, then trig function, then polynomial inner function.

Outer power derivative gives $4(\cot(-3x^2 + 8x - 7))^3$.

Trig derivative gives $-\csc^2(-3x^2 + 8x - 7)$.

Inner derivative gives $-6x + 8$.

Multiply the three derivative parts together.

$\frac{dy}{dx} = -4\,(\cot(-3x^2 + 8x - 7))^3\ \csc^2(-3x^2 + 8x - 7)\,(-6x + 8)$

S4

Differentiate with respect to x.

$y = (\tan(-4x + 3))^3\ \sec(-5x + 8)$

Answer:

$\frac{dy}{dx} = -12\,(\tan(-4x + 3))^2\ \sec^2(-4x + 3)\ \sec(-5x + 8) + (\tan(-4x + 3))^3\ -5\ \sec(-5x + 8)\tan(-5x + 8)$

Working:

This is a product, and the first factor also needs the chain rule.

Let $f = (\tan(-4x + 3))^3$ and $g = \sec(-5x + 8)$.

$f' = 3(\tan(-4x + 3))^{3-1}(\sec^2(-4x + 3))(-4)$

$f' = -12\,(\tan(-4x + 3))^2\ \sec^2(-4x + 3)$

$g' = (\sec(-5x + 8)\tan(-5x + 8))(-5)$

$g' = -5\ \sec(-5x + 8)\tan(-5x + 8)$

Apply product rule: $y' = f'g + fg'$.

$y' = (-12\,(\tan(-4x + 3))^2\ \sec^2(-4x + 3))(\sec(-5x + 8)) + ((\tan(-4x + 3))^3)(-5\ \sec(-5x + 8)\tan(-5x + 8))$

$\frac{dy}{dx} = -12\,(\tan(-4x + 3))^2\ \sec^2(-4x + 3)\ \sec(-5x + 8) + (\tan(-4x + 3))^3\ -5\ \sec(-5x + 8)\tan(-5x + 8)$
