Name _____

SA1

Use simple interest, where interest is calculated on the original principal.

£1500.00 is saved at 5% simple interest per year for 2 years. Find the interest earned and the final amount.

SA2

Apply repeated percentage change using a multiplier each year.

A savings account worth £800.00 grows by 4% each year for 2 years. Find its value after 2 years.

Savings & Borrowing

Name _____

SB1

Find the full amount repaid, then compare it with the cash price or borrowed amount.

A laptop has a cash price of £480.00. On hire purchase, a customer pays a 20% deposit and then 6 equal monthly payments. The total hire-purchase cost is £570.00. Find the deposit, each monthly payment, and the extra cost.

SB2

Use simple interest, where interest is calculated on the original principal.

£2000.00 is saved at 7% simple interest per year for 3 years. Find the interest earned and the final amount.

SA1

Use simple interest, where interest is calculated on the original principal.

£1500.00 is saved at 5% simple interest per year for 2 years. Find the interest earned and the final amount.

Answer:

£150.00 interest, £1650.00 total

Working:

Simple interest is calculated on the original amount only.

Interest = principal × rate × time.

Interest = £1500.00 × 0.05 × 2 = £150.00.

Final amount = original amount + interest.

Final amount = £1500.00 + £150.00 = £1650.00.

SA2

Apply repeated percentage change using a multiplier each year.

A savings account worth £800.00 grows by 4% each year for 2 years. Find its value after 2 years.

Answer:

£865.28, interest £65.28

Working:

Compound interest means the percentage change is applied repeatedly.

The multiplier is 1 + 0.04 = 1.04.

Final value = £800.00 × 1.04^2.

Final value = £865.28.

Interest = £865.28 - £800.00 = £65.28.

SB1

Find the full amount repaid, then compare it with the cash price or borrowed amount.

A laptop has a cash price of £480.00. On hire purchase, a customer pays a 20% deposit and then 6 equal monthly payments. The total hire-purchase cost is £570.00. Find the deposit, each monthly payment, and the extra cost.

Answer:

£96.00 deposit, £79.00 per month, £90.00 extra

Working:

Find the deposit.

Deposit = 20% of £480.00 = £96.00.

Find the amount left to pay through monthly payments.

Monthly-payment total = £570.00 - £96.00 = £474.00.

Monthly payment = £474.00 ÷ 6 = £79.00.

Extra cost = hire-purchase total - cash price.

Extra cost = £570.00 - £480.00 = £90.00.

SB2

Use simple interest, where interest is calculated on the original principal.

£2000.00 is saved at 7% simple interest per year for 3 years. Find the interest earned and the final amount.

Answer:

£420.00 interest, £2420.00 total

Working:

Simple interest is calculated on the original amount only.

Interest = principal × rate × time.

Interest = £2000.00 × 0.07 × 3 = £420.00.

Final amount = original amount + interest.

Final amount = £2000.00 + £420.00 = £2420.00.

EA1

Apply repeated percentage change using a multiplier each year.

A savings account worth £1200.00 grows by 4% each year for 2 years. Find its value after 2 years.

Answer:

£1297.92, interest £97.92

Working:

Compound interest means the percentage change is applied repeatedly.

The multiplier is 1 + 0.04 = 1.04.

Final value = £1200.00 × 1.04^2.

Final value = £1297.92.

Interest = £1297.92 - £1200.00 = £97.92.

EB1

Find the full amount repaid, then compare it with the cash price or borrowed amount.

A laptop has a cash price of £1500.00. On hire purchase, a customer pays a 25% deposit and then 6 equal monthly payments. The total hire-purchase cost is £1620.00. Find the deposit, each monthly payment, and the extra cost.

Answer:

£375.00 deposit, £207.50 per month, £120.00 extra

Working:

Find the deposit.

Deposit = 25% of £1500.00 = £375.00.

Find the amount left to pay through monthly payments.

Monthly-payment total = £1620.00 - £375.00 = £1245.00.

Monthly payment = £1245.00 ÷ 6 = £207.50.

Extra cost = hire-purchase total - cash price.

Extra cost = £1620.00 - £1500.00 = £120.00.

EC1

Use simple interest, where interest is calculated on the original principal.

£2000.00 is saved at 8% simple interest per year for 5 years. Find the interest earned and the final amount.

Answer:

£800.00 interest, £2800.00 total

Working:

Simple interest is calculated on the original amount only.

Interest = principal × rate × time.

Interest = £2000.00 × 0.08 × 5 = £800.00.

Final amount = original amount + interest.

Final amount = £2000.00 + £800.00 = £2800.00.
